Numerical Representation of Planetary Ephemerides

X. X. Newhall, Celestial Mechanics 45:305-310, 1989

Computations

A handy function to compute the derivative of a Chebyshev polynomial.

In[10]:= `DChebyshevT = Derivative[0, 1][ChebyshevT]`

Out[10]= $ChebyshevU[-1 + \#1, \#2] \#1 \&$

This function computes matrix T from Newhall's equation (5). The parameter degree is the degree of the polynomial (N in Newhall), the parameter divisions is the number of subintervals of [-1, 1] (8 in Newhall).

In[11]:=
```
NewhallT[degree_Integer, divisions_Integer] :=
Flatten[
Table[
{Table[ChebyshevT[j, i], {j, 0, degree}], Table[DChebyshevT[j, i], {j, 0, degree}]},
{i, 1, -1, -2 / divisions}],
{1, 2}]
```

This function computes matrix W used in Newhall's equation (8). The parameter w is the weight of the velocities relative to the positions (0.4 in Newhall).

In[12]:=
```
NewhallW[divisions_Integer, w_Rational] :=
 DiagonalMatrix[Flatten[Table[{1, w^2}, {divisions + 1}]]]
```

The following functions compute the four blocks of matrix C1 and assemble them to form C1 .

In[13]:=
```
NewhallC1UpperLeft[degree_Integer, divisions_Integer, w_Rational] :=
 NewhallT[degree, divisions]ᵀ . NewhallW[divisions, w] . NewhallT[degree, divisions]
```

In[14]:=
```
NewhallC1UpperRight[degree_Integer] :=
Table[{ChebyshevT[i, 1], DChebyshevT[i, 1],
    ChebyshevT[i, -1], DChebyshevT[i, -1]}, {i, 0, degree}]
```

In[15]:= `NewhallC1LowerLeft[degree_Integer] := NewhallC1UpperRight[degree]ᵀ`

In[16]:= `NewhallC1LowerRight[] := Table[0, {4}, {4}]`

In[17]:=
```
NewhallC1[degree_Integer, divisions_Integer, w_Rational] :=
ArrayFlatten[
{{NewhallC1UpperLeft[degree, divisions, w], NewhallC1UpperRight[degree]},
{NewhallC1LowerLeft[degree], NewhallC1LowerRight[]}}]
```

The following functions compute the two blocs of matrix Subscript[C, 2] and assemble them to

form Subscript[C, 2].

In[18]:= `NewhallC2Upper[degree_Integer, divisions_Integer, w_Rational] :=`
   `NewhallT[degree, divisions]ᵀ . NewhallW[divisions, w]`

In[19]:= `NewhallC2Lower[divisions_Integer] :=`
   `Drop[IdentityMatrix[2 divisions + 2], {3, 2 divisions}]`

In[20]:= `NewhallC2[degree_Integer, divisions_Integer, w_Rational] :=`
   `ArrayFlatten[{{NewhallC2Upper[degree, divisions, w]}, {NewhallC2Lower[divisions]}}]`

This function computes the matrix Subscript[C, 1]^-1 . Subscript[C, 2]. Newhall doesn't give it a name but calls its elements Subscript[c, k], so let's use the name C.

In[21]:= `NewhallC[degree_Integer, divisions_Integer, w_Rational] :=`
   `Inverse[NewhallC1[degree, divisions, w]] . NewhallC2[degree, divisions, w]`

This function expresses C in a way that is suitable for obtaining the coefficients of a polynomial in the monomial base, not in the Chebyshev base. It drops the last 4 rows corresponding to the Lagrange multipliers.

In[22]:= `NewhallMonomialC[degree_Integer, divisions_Integer, w_Rational] :=`
   `Table[`
   `Sum[`
   `NewhallC[degree, divisions, w]⟦n⟧ × Coefficient[ChebyshevT[n - 1, x], x, k],`
   `{n, 1, degree + 1}],`
   `{k, 0, degree}`
   `]`

Formatting and Output

Produces a representation of a matrix as an initializer_list containing initializer_lists. (Note that this function is unused and might need to change, e.g., to use std::array if we wanted to use it.)

In[23]:= `BidimMatrixToCDefinition[type_String, variable_String, matrix_List] :=`
   `type <> " const\r\n    " <> variable <> "(\r\n" <>`
   `StringReplace[`
   `ToString[CForm[matrix]],`
   `{"List(List(" → "        {{",`
   `"List(" → "{",`
   `")," → "},\r\n        ",`
   `"," → ",\r\n        ",`
   `"))" → "}});\r\n\r\n"}]`

Produces a representation of a matrix as a single, flattened initializer list.

In[24]:=
```
FlattenedMatrixToCDefinition[type_String, element_String,
  dimension1_String, dimension2_String, variable_String, matrix_List] :=
 "constexpr " <> type <> "<" <> element <> ", " <> dimension1 <> ", " <>
  dimension2 <> ">\r\n    " <> variable <> "(\r\n        std::array<" <>
  element <> ", " <> "(" <> dimension1 <> ") * (" <> dimension2 <> ")>{\r\n" <>
 StringReplace[
 ToString[CForm[matrix]],
 {"List(List(" → "            {",
 "List(" → "\r\n             ",
 ")," → ",\r\n",
 "," → ",\r\n            ",
 "))" → "}});\r\n\r\n"}]
```

Produces a representation of a list as an initializer list.

In[25]:=
```
ListToCDefinition[type_String, variable_String, list_List] :=
 type <> " const\r\n    " <> variable <> "(\r\n" <>
 StringReplace[
 ToString[CForm[list]],
 {"List(" → "        {",
 "," → ",\r\n         ",
 ")" → "});\r\n\r\n"}]
```

Writes all the Newhall C matrices to a single file. Note that we drop the last 4 rows because they correspond to the Lagrange multipliers.

```
In[26]:= file =
    OpenWrite[
    FileNameJoin[{DirectoryName[NotebookDirectory[]], "numerics",
        "newhall_matrices.mathematica.h"}], BinaryFormat → True, PageWidth → Infinity];
    WriteString[
    file,
    FromCharacterCode[16^^ef] <> FromCharacterCode[16^^bb] <> FromCharacterCode[16^^bf] <>
